Cross-sectional MRI records: 12,151 (3,231 participants)
Longitudinal MRI pairs: 6,213 (1,850 participants)
MRI pairs with a 3–18-month interval after volume-range and change-direction filters
1,474 participants
One pair per participant (nearest 10.5 months)
n = 1,474
Documented source QC failure (n = 5)
n = 1,469
Dementia recorded at or before the second MRI (n = 424)
Death before the second MRI (n = 6)
n = 1,039
No recorded MCI at baseline MRI (n = 652)
No recorded MCI at second MRI (n = 182)
Landmark-eligible MCI risk set
n = 205
Outcome not classifiable (n = 84)
insufficient follow-up 79; death 3;
other dementia or conflicting records 2
Classified cohort
n = 121 (37 AD events)
Post hoc numerical plausibility rules
(n = 15; 2 events)
Rule A, absolute ICV change > 5% (n = 11)
Rule B, |regional robust z| > 4 (n = 4)
Primary cohort
n = 106 (35 AD events)
Training: n = 76 (26 events)
Internal holdout: n = 30 (9 events)
